- Simulation results
 - Coevolution of compositionality and regularity;
 - “Bottom-up” syntactic developmental process;
 - Cultural influence on language evolution;

- Discussion and some collaboration aspects
 - Neural basis of language-related abilities;

The simulation perspective

Contemporary linguistic research methods

- Empirical data collections:
 - **Corpus linguistics** (Kučera and Francis 1967): e.g., *Child Language Data Exchange System* (CHILDES, <http://childes.psy.cmu.edu>), *Linguistic Data Consortium* (LDC, <http://www ldc.upenn.edu>);

- Behavioral study on subjects' performance in linguistic tasks:
 - **Categorical perception**: Zheng Hongying's work;
 - **Anticipatory and carryover effects**: Wong Yingwei's work;
 - **Neural activities during production or comprehension related linguistic behaviors**: Susan Shuai's, Yang jing's and Alice Chan's work;

- Computational simulation:
 - **Artificial neural network model**: Francis' work;

The simulation perspective

- **The simulation perspective:** to adopt computational simulations to recapitulate the evolution of human language, reconstruct the language history, and reconsider the effects of linguistic and nonlinguistic factors on this developmental process.

- **Behaviourist simulations**

- **Artificial neural network:**

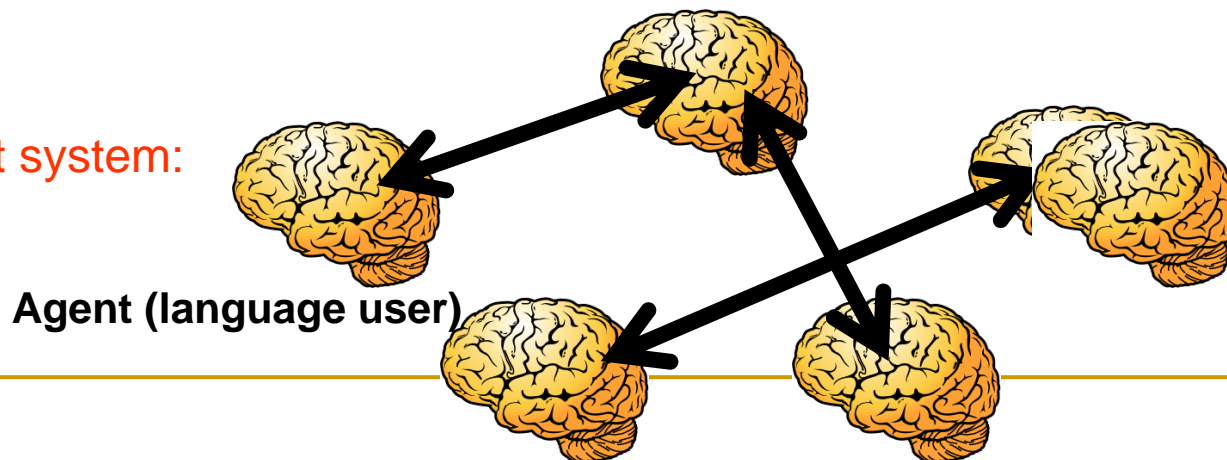

- **Rule-based system:**

“cat” \leftrightarrow /cat/; “run” \leftrightarrow /run/;
/cat/ \ll /run/

- **Multi-agent system:**

A compositionality-regularity coevolution model

Linguistic universals: compositionality and regularity

- **Compositional expressions:** the meaning of a complex expression is determined by its components (lexical items)' meanings.
 - E.g., **English:** “eat<dog, meat>” \leftrightarrow /DOG EAT MEAT/
 - Chinese:** “吃<狗,肉>” \leftrightarrow /狗 吃 肉/

- **Holistic expressions:** the meaning of a complex expression is determined as a whole, inseparable.
 - E.g., **English:** “to be angry” \leftrightarrow /HIT THE CEILING/
 - Chinese:** “to miss the appoint” \leftrightarrow /放鴿子、放飛幾/

- **Regularity:** the meaning of a complex expression is also determined by its structures (e.g., word order).
 - E.g., different word order affects the meaning;
 - English (Subject Verb Object):**
 - “bite<dog, man>” \leftrightarrow /DOG BITE MAN/;
 - “bite<man, dog>” \leftrightarrow /MAN BITE DOG/

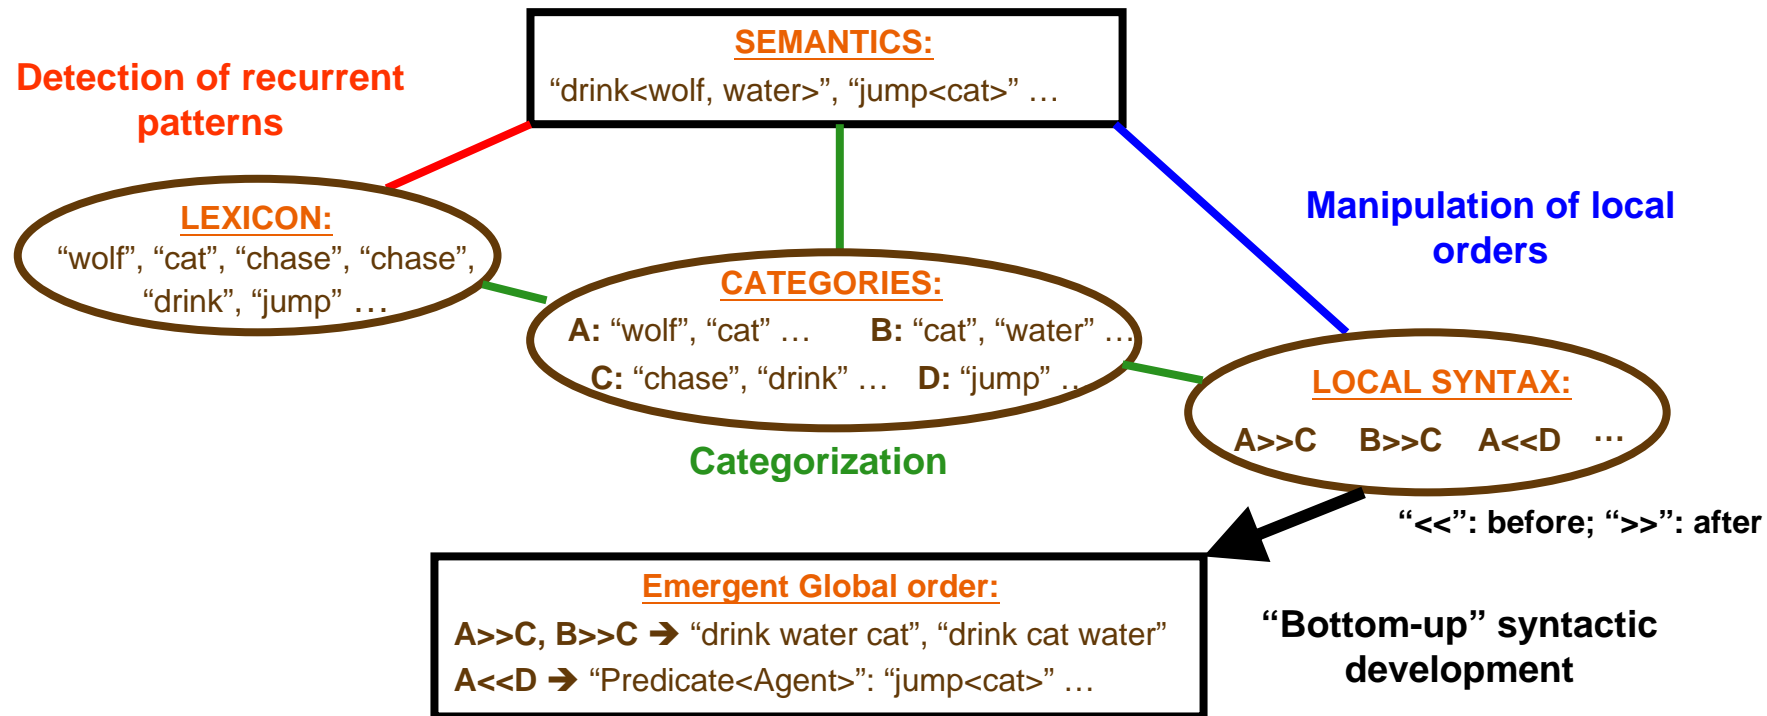

How did compositionality (lexical items) and regularity (word order) emerge in human language?

A compositionality-regularity coevolution model

Our coevolution scenario of developing compositionality and regularity

- **Our hypothesis:** coevolution of compositionality and regularity out of a holistic signaling system

Local syntax: binary sequential relation (before or after) between 2 lexical items, e.g., SV, OV, SO;

Global word order (e.g., SVO, SOV) results from local syntax;

A compositionality-regularity coevolution model

Representation and acquisition of linguistic knowledge

- **Linguistic rule:** condition (M-U mapping or local syntax) + (strength);

- **Integrated meanings:**

Type1: “Pr₁<Ag>”: e.g., “run<dog>”;

Type2: “Pr₂<Ag, Pat>”: e.g., “chase<fox, wolf>”;

- **Lexical rule:** how to map semantic components to utterance syllables;

Holistic rules

(1) “chase <wolf, bear>” \leftrightarrow /a d/ (0.5)

(2) “hop <deer>” \leftrightarrow /a/ (0.4)

Compositional rules

(3) “wolf” \leftrightarrow /d/ (0.6)

(4) “chase <#, bear>” \leftrightarrow /a b * d/ (0.7)

- **Syntactic rule:** local syntax (BEFORE / AFTER) on regulating 2 lexical rules' syllables.

(I) Cat1 << Cat2 (SV) (0.5)
BEFORE

(II) Cat1 >> “fight<#, #>” \leftrightarrow /d/ (0.4)
AFTER

A compositionality-regularity coevolution model

Representation and acquisition of linguistic knowledge

- **Syntactic categories:**
 - Syntactic role (S, O or V), Lex-List and Syn-List;
 - **[Association weights]:** the strength to associate a lexical rule into a category;

A compositionality-regularity coevolution model

Representation and acquisition of linguistic knowledge

■ Acquiring lexical rules

- Random creation of holistic rules and **Detection of recurrent patterns;**

■ Acquiring local orders and syntactic categories

- Lexical rules **with same semantic role** and **similarly used (local order)** in M-U mappings can be associated into categories; **lexical rules**

Newly acquired lexical rules in
Rule list (long-term memory)

M-U mappings (**previous
experience**) in individual's
Buffer (**short-term memory**)

Newly acquired categories in
Rule list (long-term memory)

Lex-List

(a) “fox” ↔ /d/ (0.5) [0.5]

(c) “wolf” ↔ /a c/ (0.5) [0.5]

Syn-List

Cat1 << rule (b) (0.5)

Lex-List

(b) “run<#>” ↔ /m/ (0.5) [0.5]

(d) “chase<#, #>” ↔ /b/ (0.5) [0.5]

Syn-List

Cat1 << rule (c) (0.5)

(a) “fox” ↔ /d/ (0.5) { (1) “hop<fox>” ↔ /d h/

(b) “run<#>” ↔ /m/ (0.5) { (2) “run<fox>” ↔ /d m/

(c) “wolf” ↔ /a c/ (0.5) { (3) “run<wolf>” ↔ /a c m/

(4) “chase<wolf, deer>” ↔ /a c b e/

Cat 1 (S)

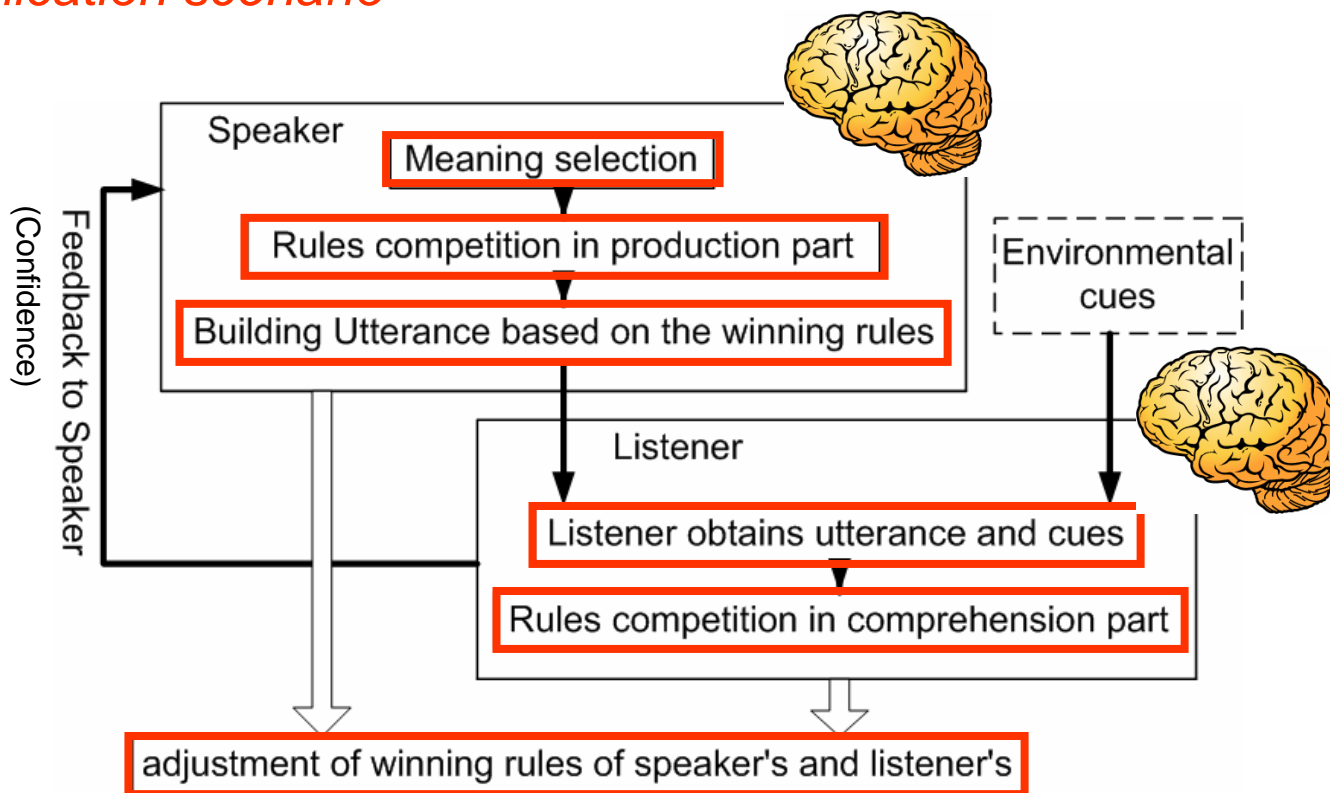

Cat 2 (M)

! Don't consider reflexive meanings in which two arguments of a transitive verb are identical.

A compositionality-regularity coevolution model

Communication scenario

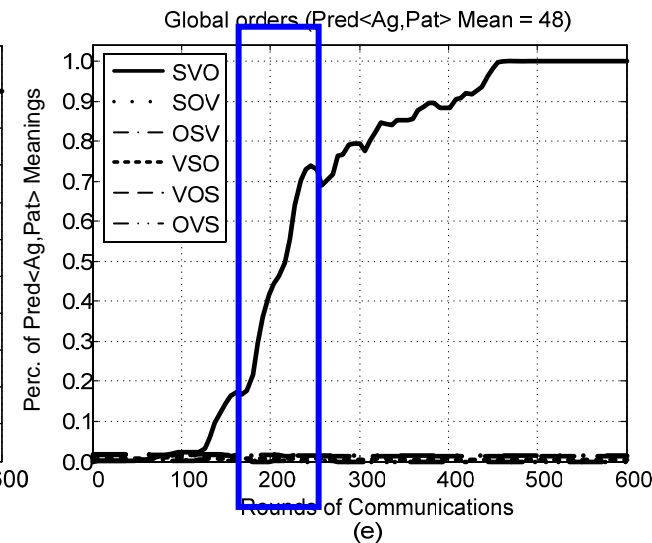

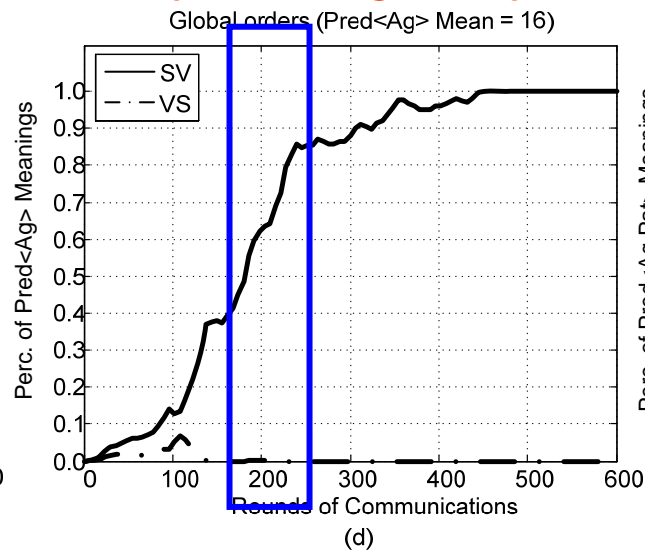

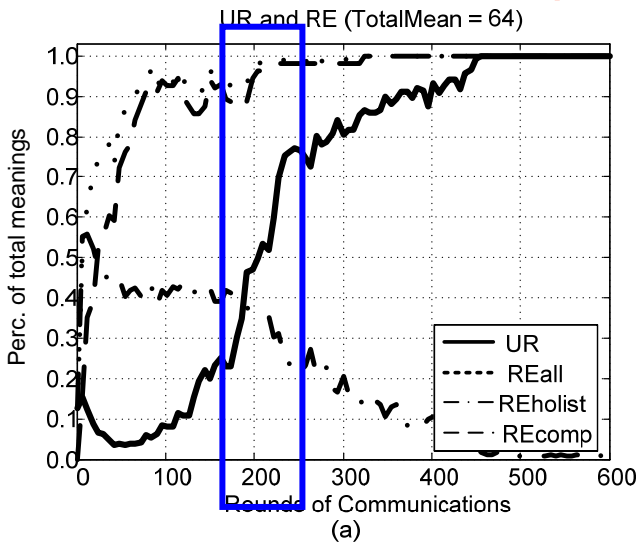

■ Indirect Meaning Transference:

- ❑ Independent linguistic knowledge;
- ❑ Confidence feedback based on the combined strength of the used rules;

Simulation results

Coevolution of compositionality and regularity

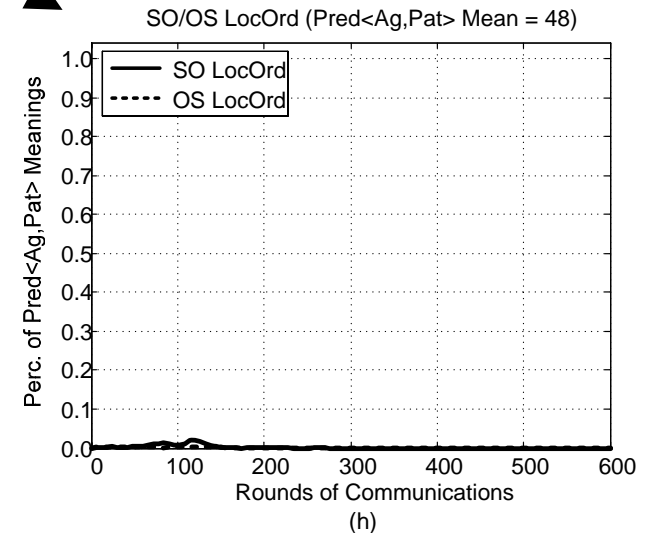

- **Emergence of compositionality:**
 - RE → Holistic signals → compositional expressions;
 - UR → the emergence of a common compositional language.
- **Emergence of regularity:** some global word orders becoming **prevalent**;
 - **Prevalent order:** the global / local orders that are frequently used in comprehensions;
 - e.g., **SV** for “Pr₁<Ag>” meanings; **SVO** for “Pr₂<Ag, Pat>” meanings;
- **Coevolution of compositionality and regularity:**
 - The co-occurrence of the sharp increase of the UR and the sharp increase of the understandability of the prevalent global word orders;

Simulation results

"Bottom-up" syntactic developmental process

Global order's understandability

Local order's understandability

- The prevalent global word order reflects the local sequential information specified by the prevalent local syntax;

Simulation results

Cultural influence on language evolution

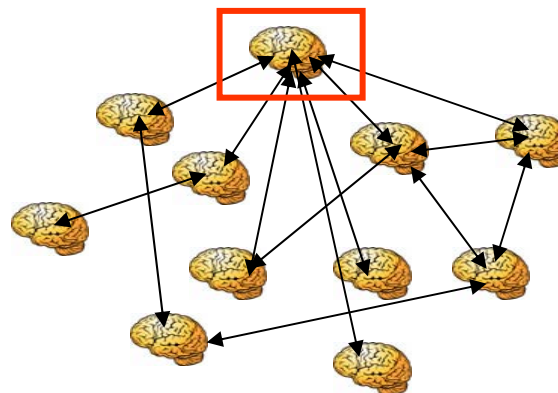

■ Language is developed in a cultural environment:

- Cultural transmission:

Time

- Social structure's effects:

- Language contact:

Discussion and some collaboration aspects

Neural basis of language-related abilities

- Most language-related abilities built in this model are domain-general, not specific for humans or language;
 - Empirical support from animal studies;
- The neural basis of language-related abilities:
 - The pattern extraction ability for compositionality:

The mid-dorsolateral prefrontal cortex (BA 9/46) increased activity at the point when the current information must be related to earlier events stored in working memory.

Monchi et al. 2001. Wisconsin card sorting revisited. *The Journal of Neuroscience*, 21(19): 7733-7741.

Discussion and some collaboration aspects

Neural basis of language-related abilities

- The sequential learning ability for regularity:
 - The subcortical structure, **Basal ganglia**, plays the sequencing role of in motor control as well as syntactic abilities in human language (Lieberman 2006)

(from Edelman, G. M. and Tononi, G. 2000. *A universe of consciousness: How matters become imagination*. New York: Basic Books)

Lieberman, P. 2006. *Towards an evolutionary biology of language*. Cambridge, MA: Belknap Press of Harvard University Press.

Discussion and some collaboration aspects

Neural basis of language-related abilities

- Language is a whole brain function:
 - Linguistic knowledge is stored as **complex neural networks** in human brains (Lieberman 2006);
 - **Complex network theory** provides guidelines for the study of linguistic activities in human brains.

The Social Structure of "Countryside" School District

Edelman, G. M. and Tononi, G. 2000. *A universe of consciousness: How matters become imagination*. New York: Basic Books.

Discussion and some collaboration aspects

Multi-perspectives to tackle linguistic problems

- Analysis of linguistic database;
- Digest of linguistic theories;
- Psychological studies on linguistic behaviors;

- Empirical basis for simulated linguistic behaviors ;
- Suggest new related behaviors for simulations;
- Implement linguistic behaviors and study their long-term effects on language evolution;
- Suggest further behavioral studies about simulated linguistic behaviors;
