

Native language and modality shapes structural connectivity in the brain

Alfred Anwander

Max Planck Institute
for Human Cognitive and Brain Sciences
Leipzig, Germany

Language processing in the brain:

Classical language centers

Paul BROCA

1865

*motor language region
(Broca's area)*

*sensory language region
(Wernicke's area)*

Carl WERNICKE

1874

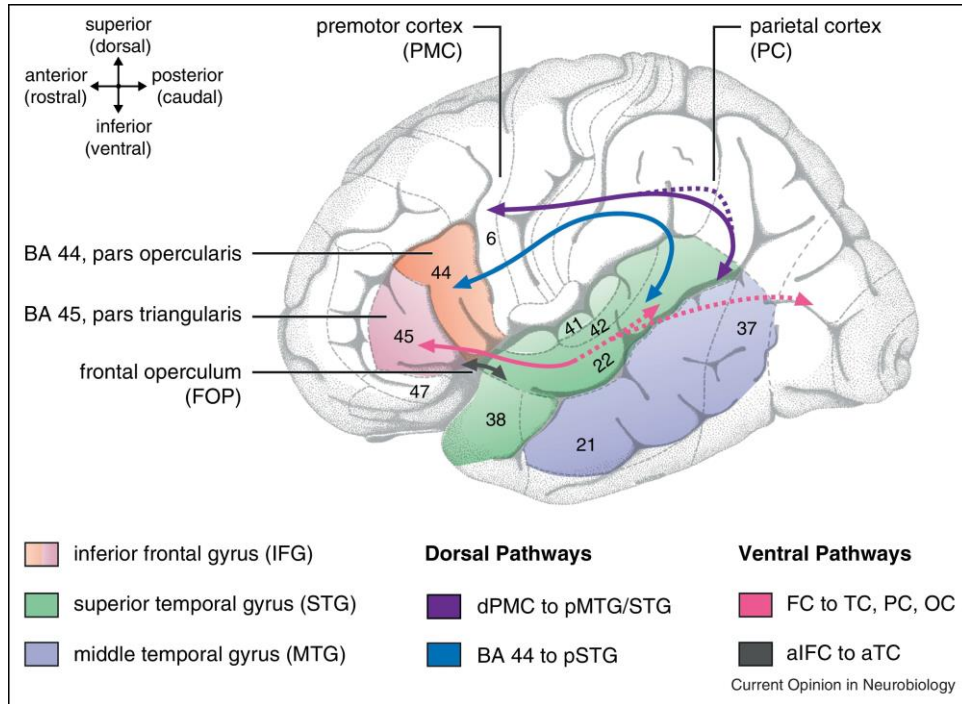

Structural connectivity between the language cortices

Structural connectivity between the language cortices

Dorsal and ventral tracts for language

Regional Functions:

STG/IPL: Phonological processing
MTG: lexical-semantic processing
BA44: Complex syntax processing
BA45: Semantic processing

Pathway :

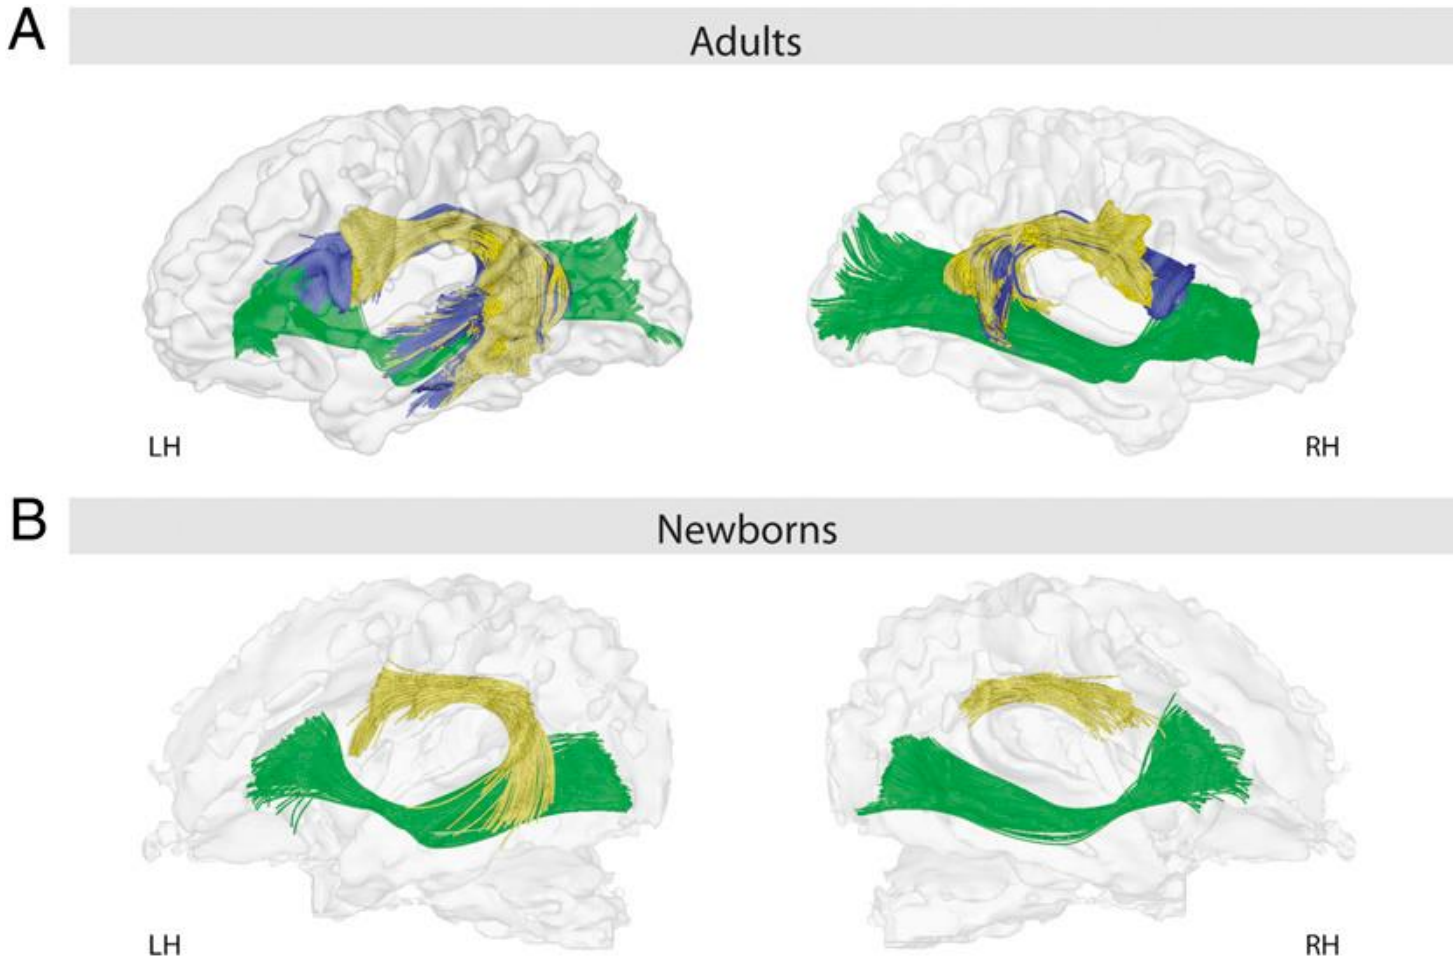

dPMC- STG/IPL: Auditory-motor mapping
BA44- pSTG: Complex syntax processing
aIFG-aTC: Elementary combination
FC-TC,PC,OC : Semantic processing

Dorsal tracts: comprehension and production of complex syntax

Ventral tracts: Simple syntax and semantic processing

Dynamic changes in brain connectivity during development

- Newborns: weak connections between the language regions
- Myelination starts after birth
- The network of connections is molded from the external world during development

How language shapes the brain:

Cross-linguistic differences in
the universal language
network

Different languages – Different strategies?

German

Free word order
(verb at the end)

Informative **syntax**

English

Fixed word order

Little syntax

Friederici

Mandarin Chinese

Tonal language

Abundant **homophones**

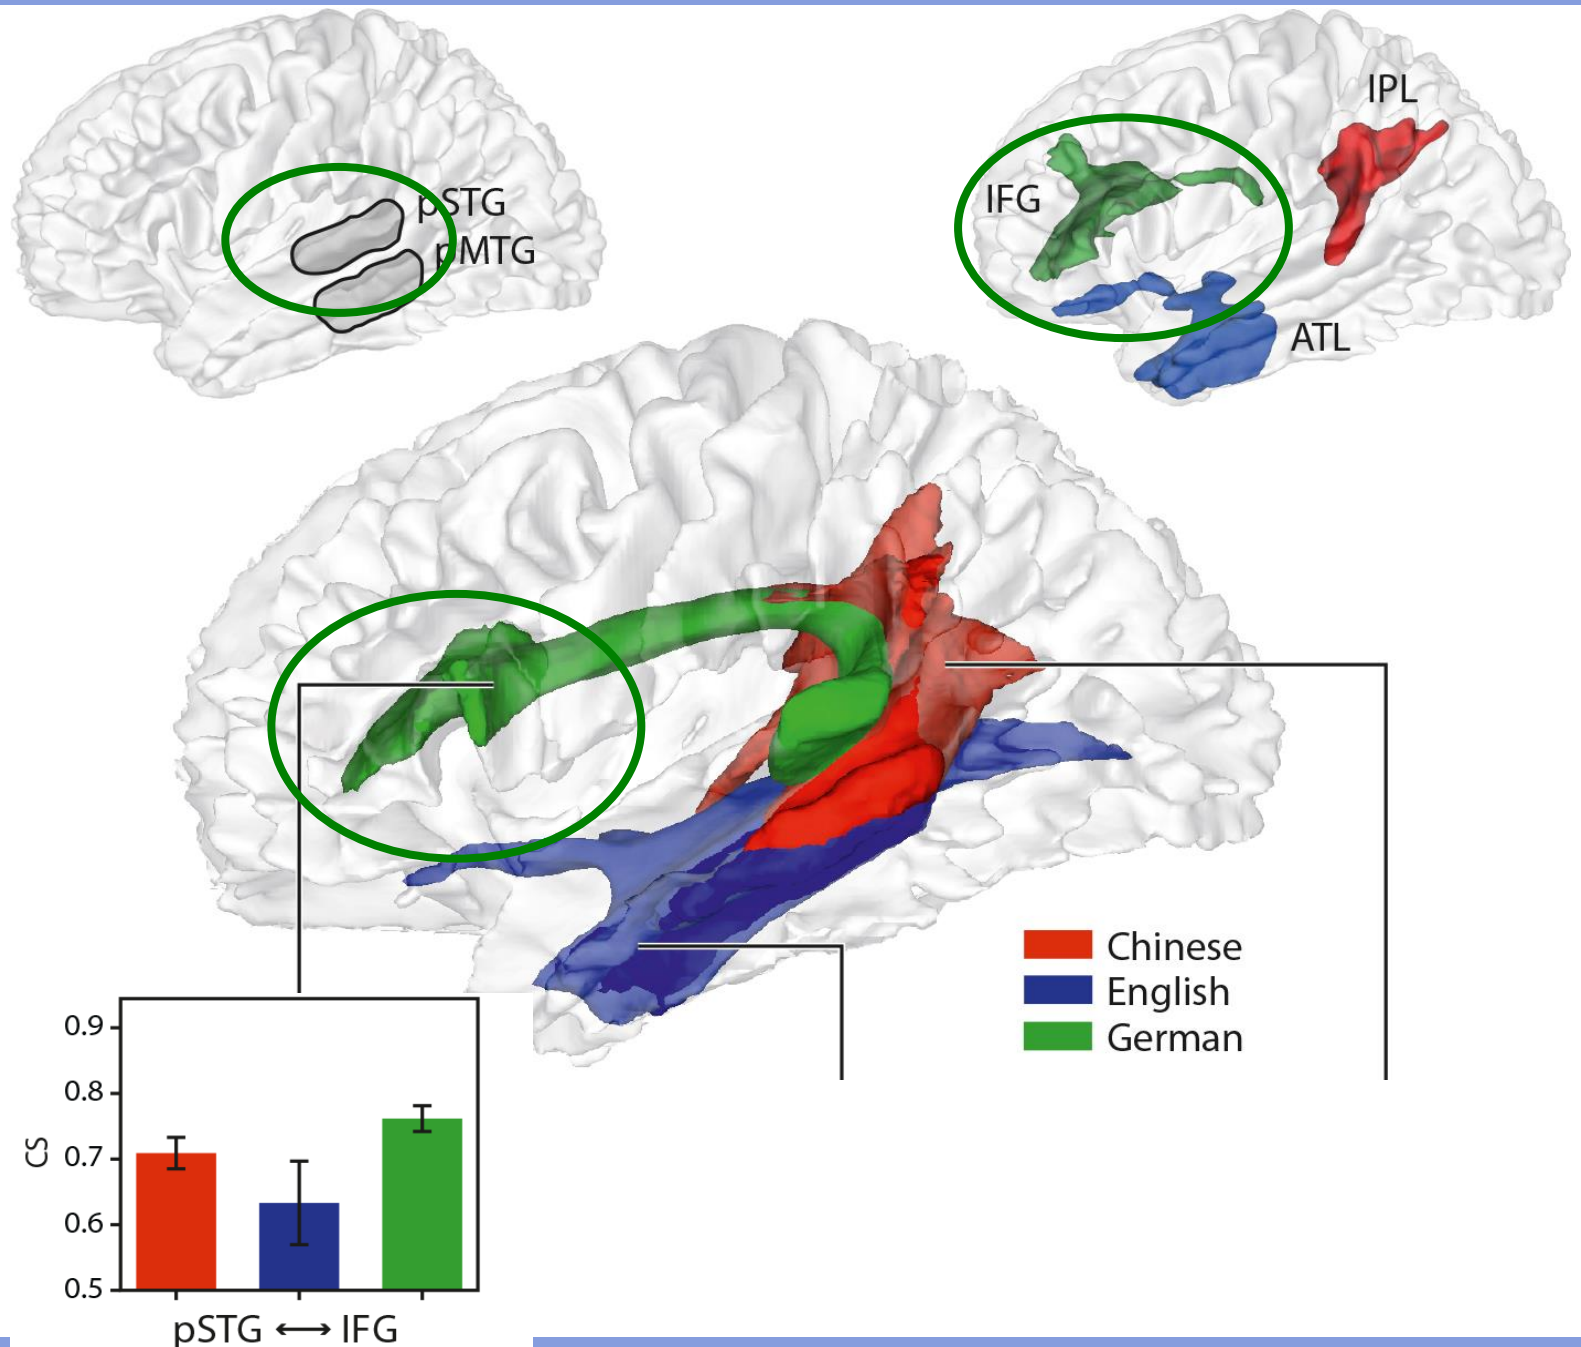

Tomás
Goucha

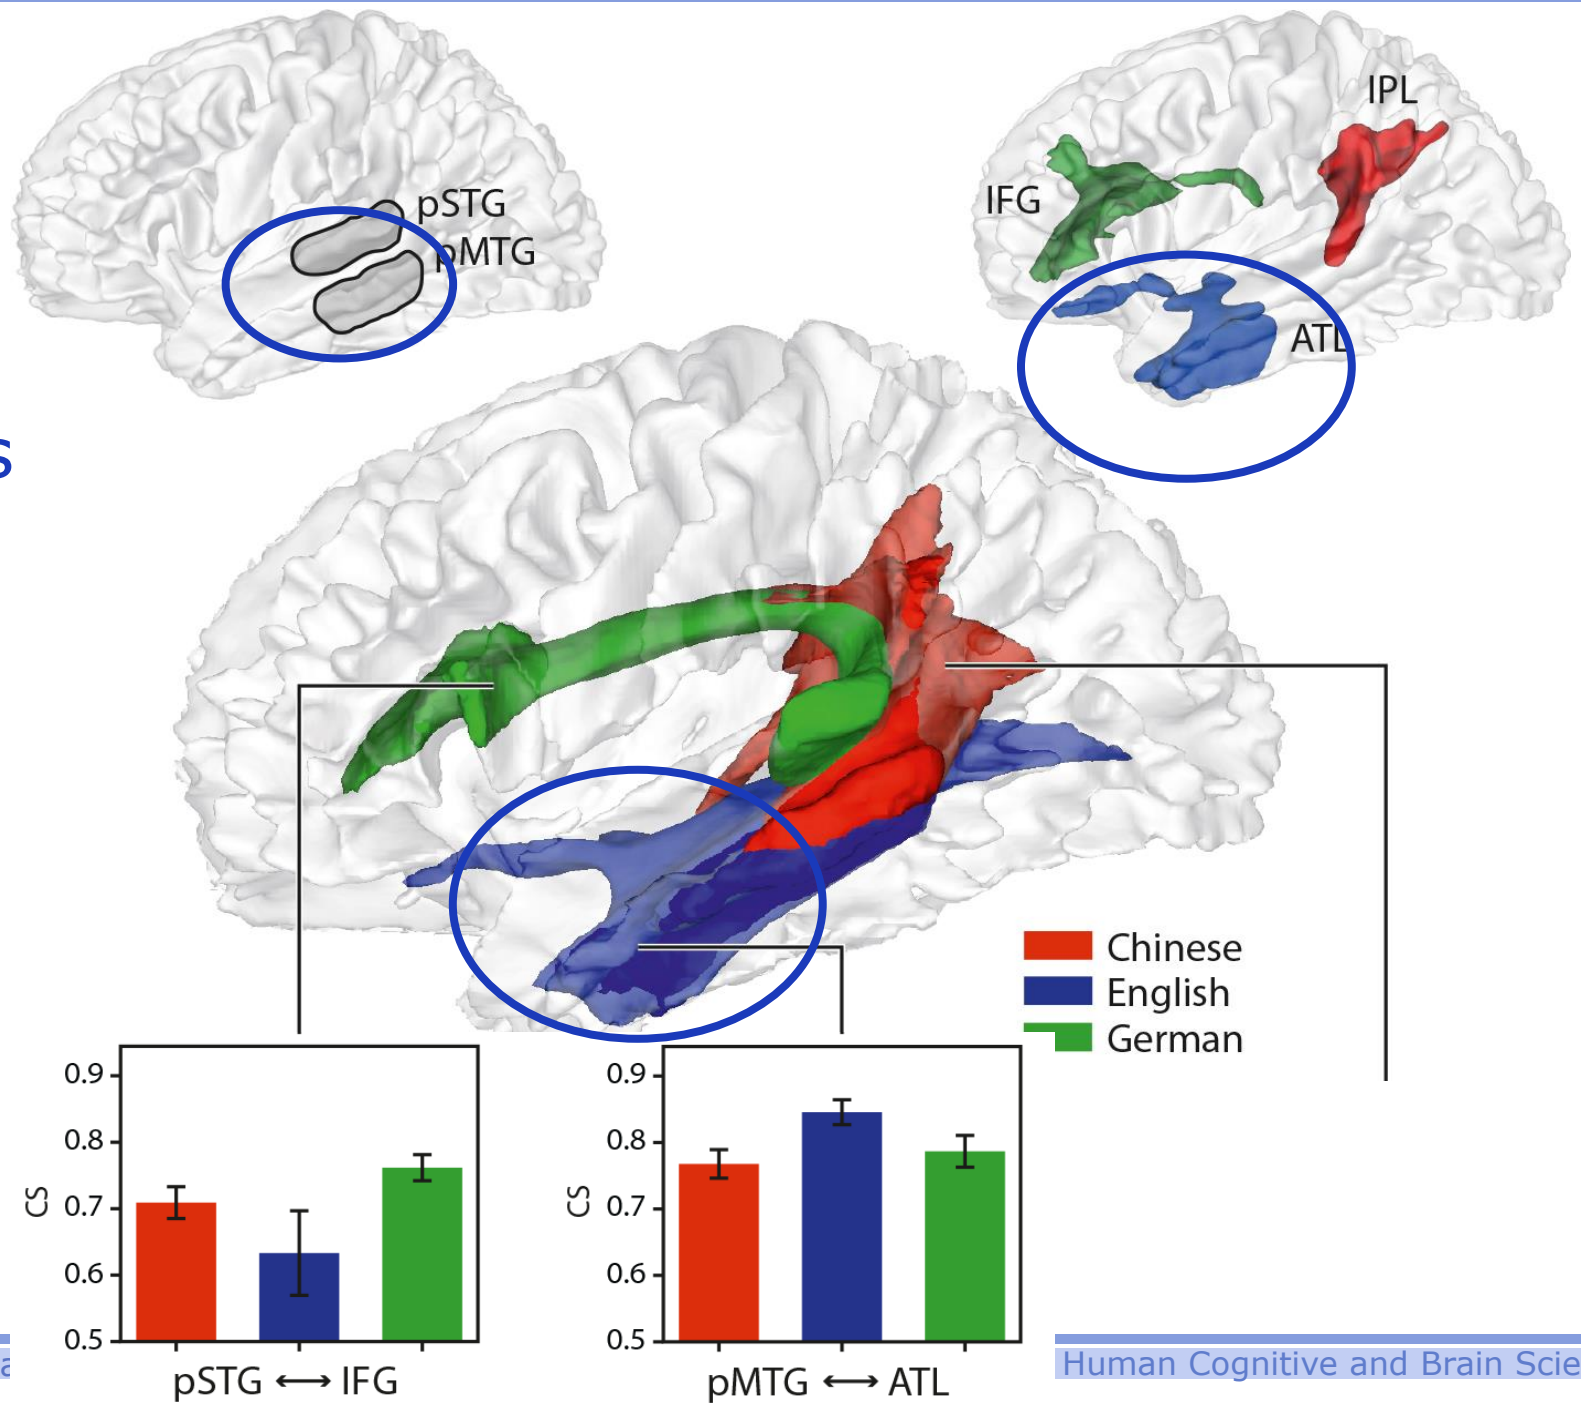

Conjunction across languages

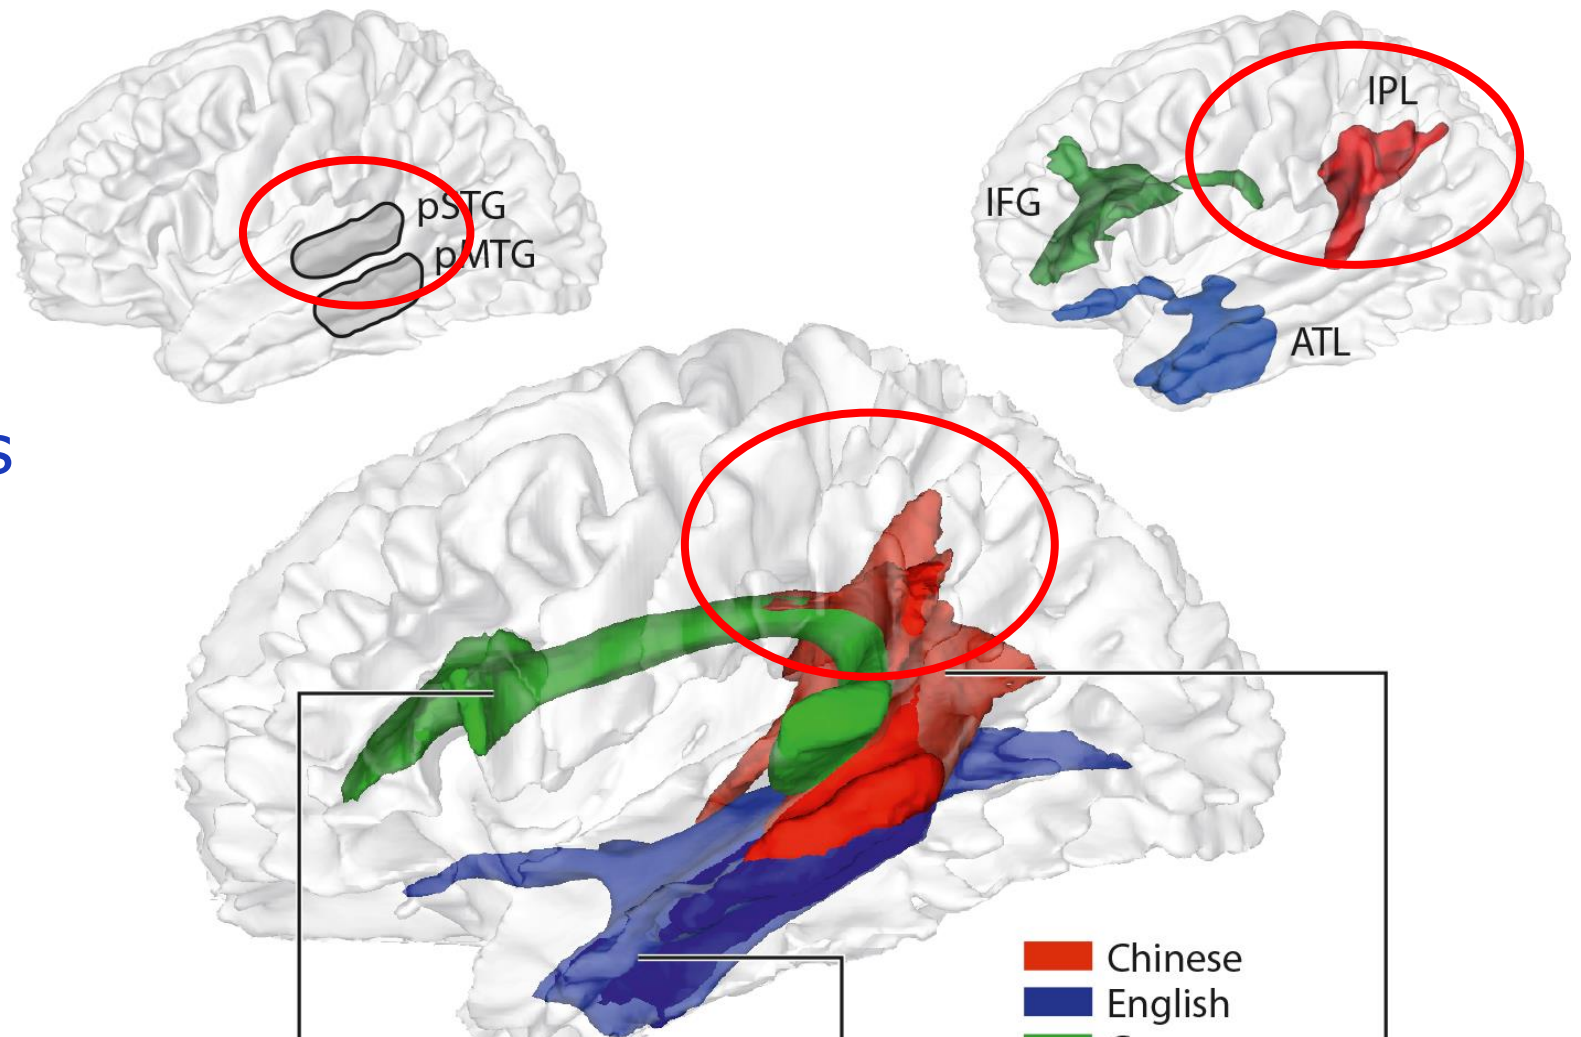

- N=30 German
- N=20 English
- N=30 Chinese
- Matched for:
gender, age,
handedness,
level of education
- Replication
second dataset
(18+18+18)

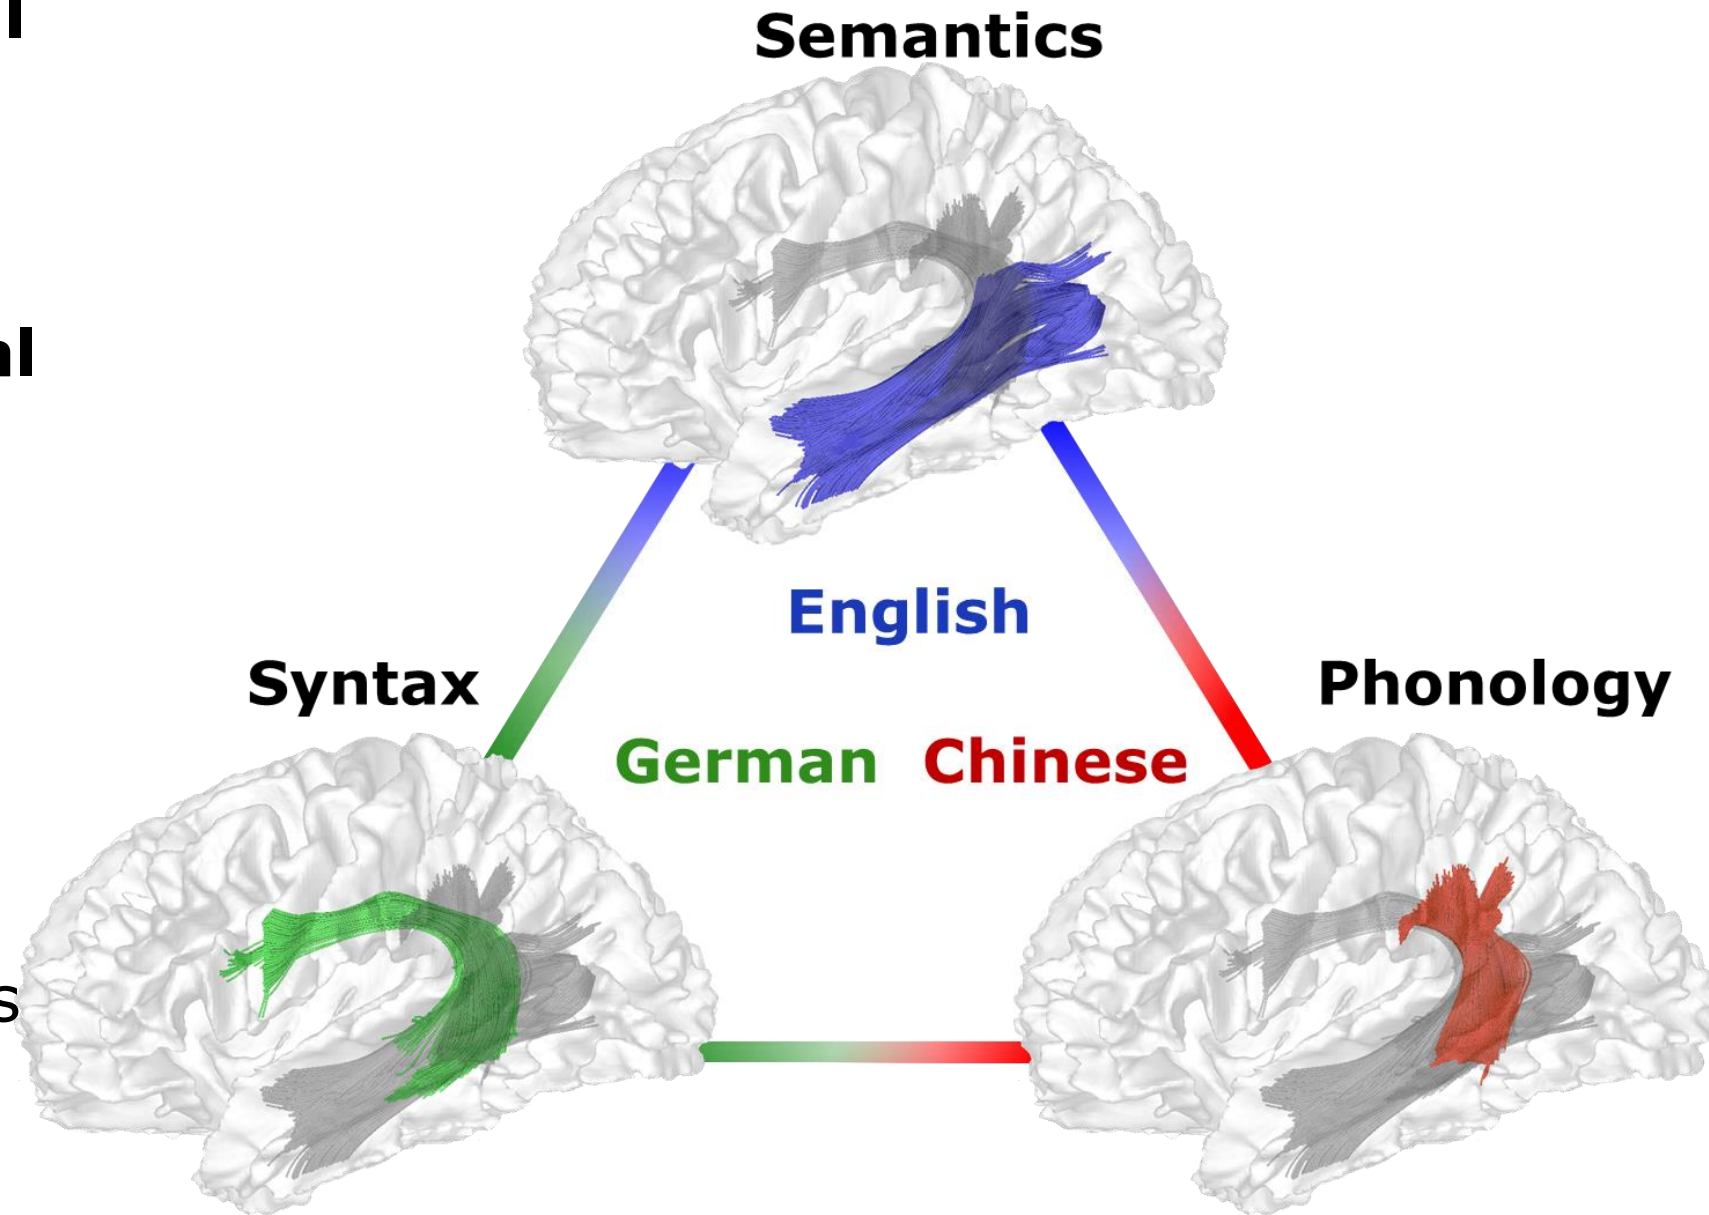

Conjunction across languages

Conjunction across languages

- **German** group –**dorsal** connectivity – **grammatical** cues
- **English** group –**ventral** connectivity – word **meaning** associations
- **Chinese** group – **temporo-parietal** and interhemispheric connectivity – **phonological** demands of tonal language frequent homophones

Language without speech: Language network in prelingually deaf signers

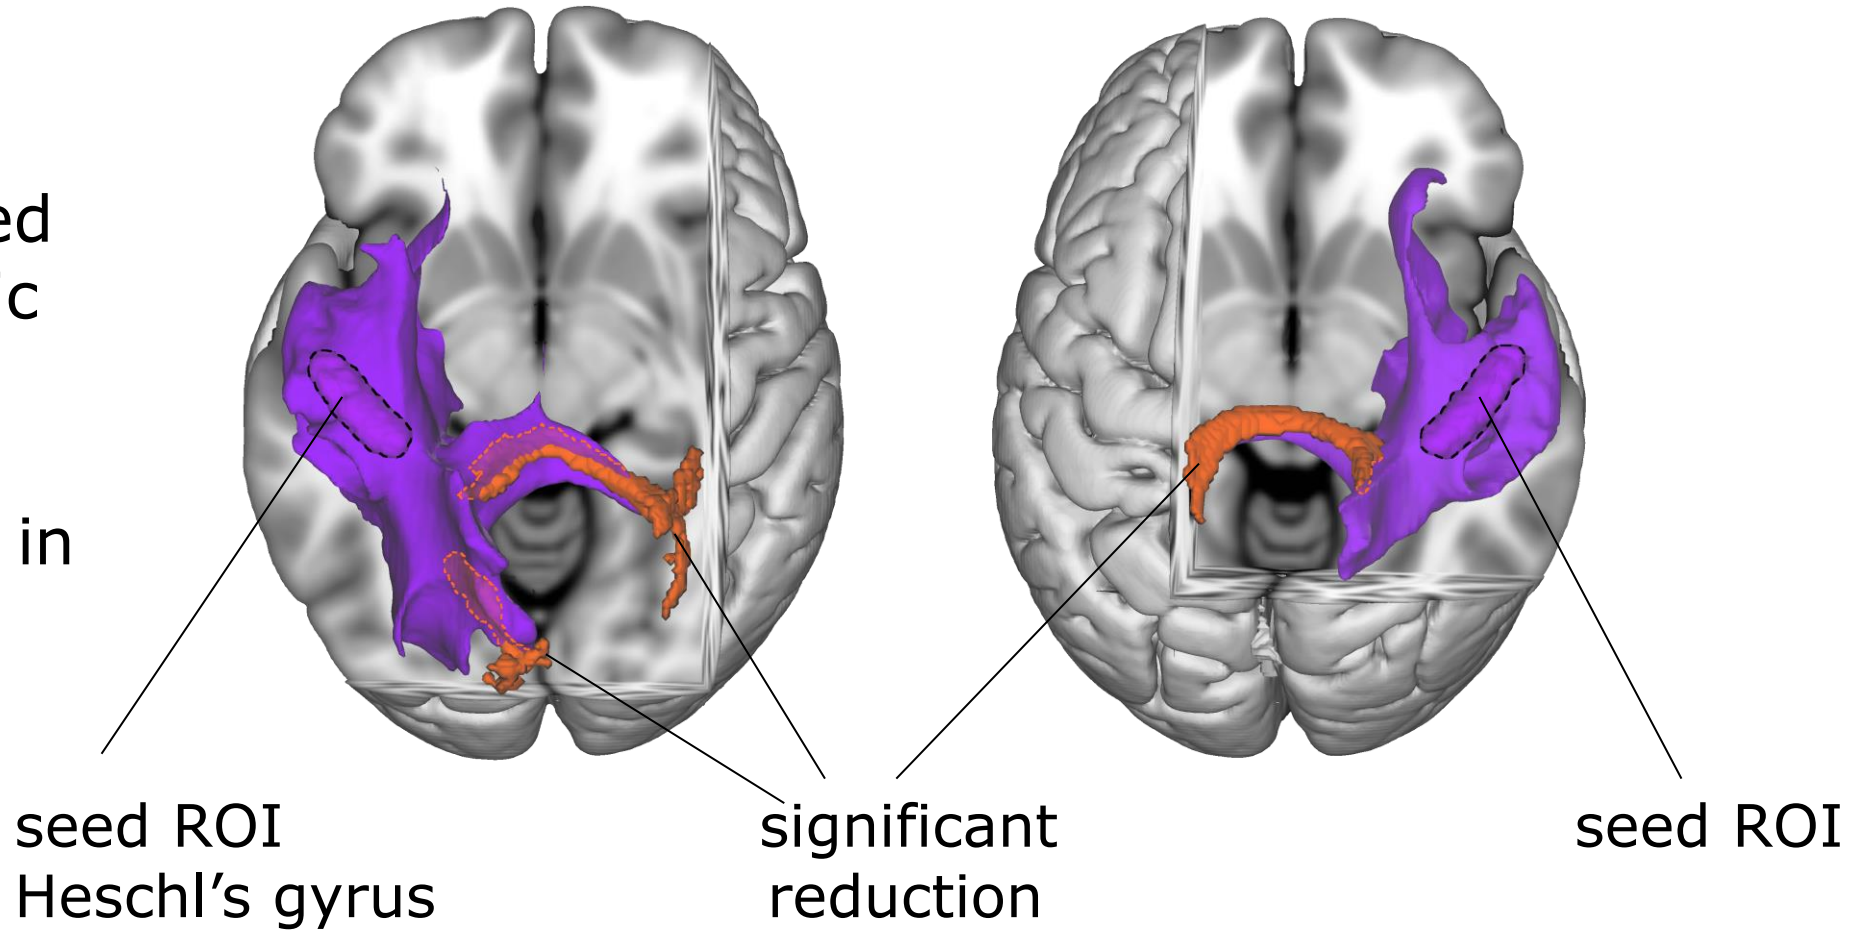

- **Compare connectivity in the dorsal language processing network between signers and controls:**

- Is the **language** network affected by missing **auditory input** and missing **speech** production?

Primary Auditory Cortex

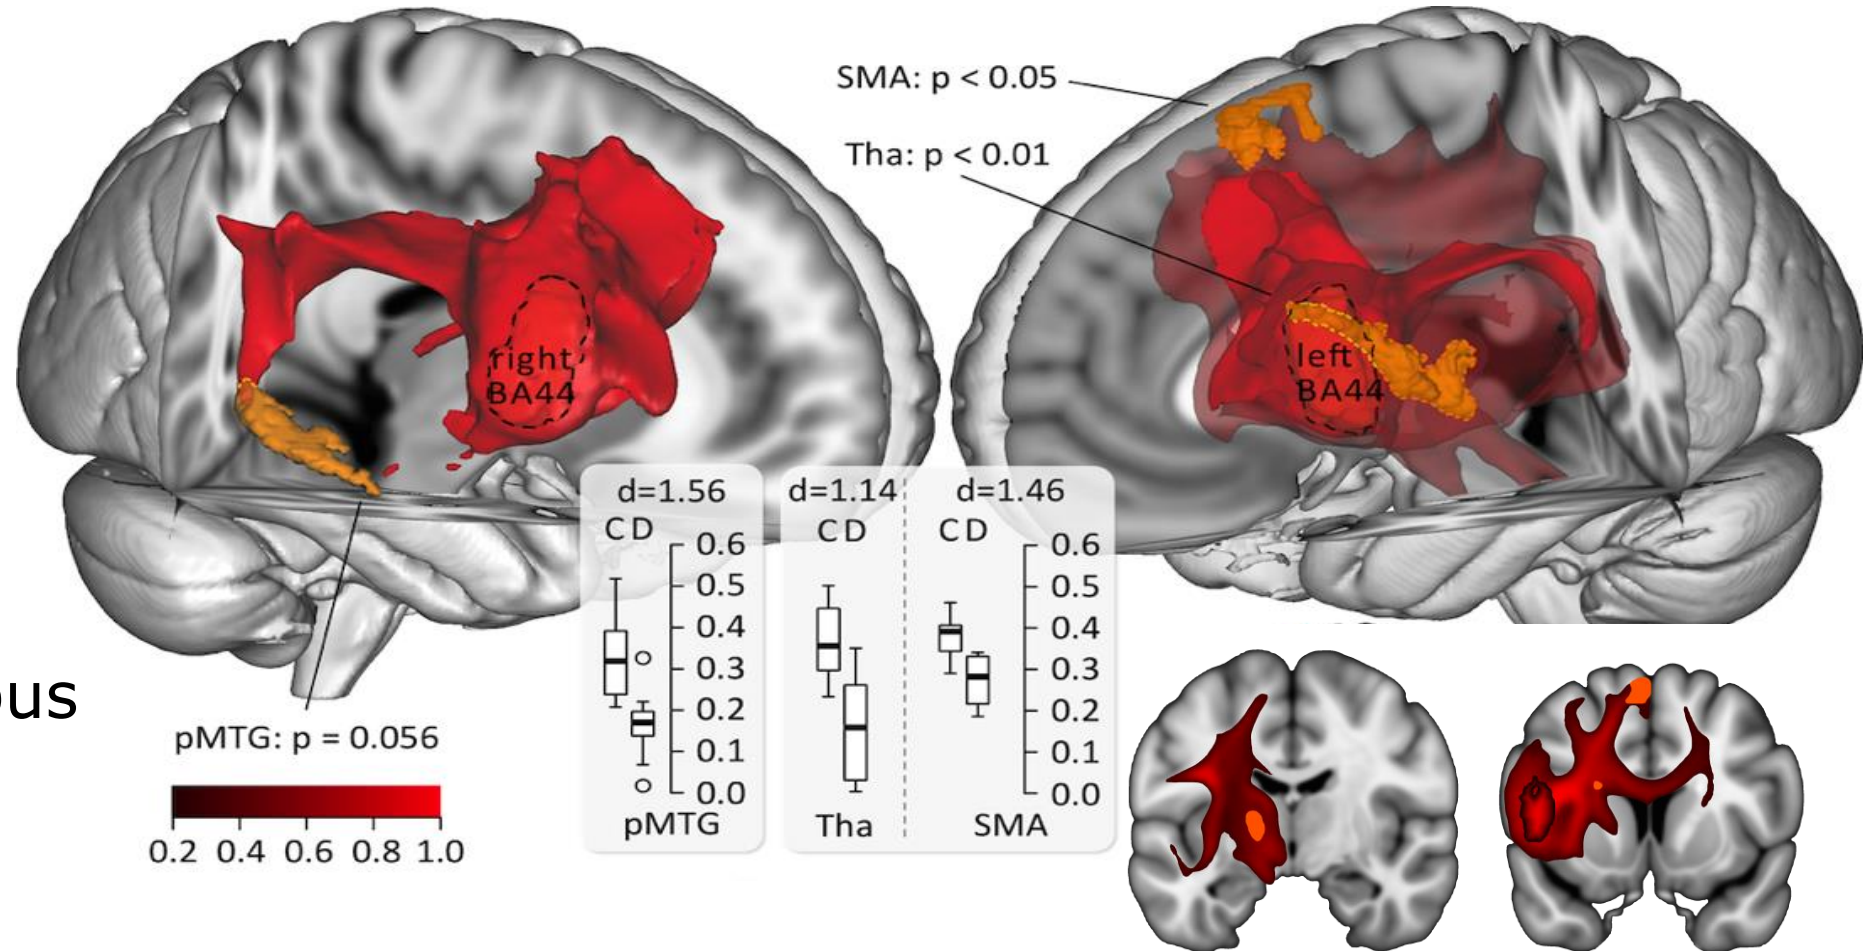

- Strongly reduced interhemispheric connectivity in signer
- Left: Reduction in connectivity to precuneus

BA44 - Speech Planning and Syntax

- Left: Reduced connectivity to pre-SMA and thalamus
- Right: Reduced connectivity to MTG/hippocampus
- Arcuate fascicle unchanged

Language without speech

- Signers show normally developed dorsal language network
- Missing auditory input causes **reduced interhemispheric connectivity** of primary auditory cortex
- Missing speech production is linked to a reduced connectivity of BA44 to **pre-SMA** and the **thalamus**

From connections to the connectome

Language network differences between speakers of Arabic and German

Wei

German and Arabic language features

German

Free word order
(verb at the end)

Informative **syntax**

Arabic

Root-based language with
complex morphology

Word: root (semantic)
+ word-pattern

ROOT

Shape	ب	ت	ك
Symbol	b	t	k
Meaning	write		

Meaning	Transcription	Arabic
a book	kita ab	كِتَاب
a writer	kati b	كَاتِب
he writes	yak tab	يَكْتُب
she writes	ta ktub	تَكْتُب

● Missing short vowels in script

Name	Symbol	Diacritical Mark
fatHaṭ	a	َ
Dammaṭ	u	ُ
kasraṭ	i	ِ

Taha and Saiegh-Haddad, 2017; Al Kaabi, 2016

Differences in connection strength per region

German native speakers show higher centrality than Arabic native speakers in the left IFG

Difference in sub-regions of the IFG

German > Arabic

Arabic > German

No significant higher node centrality in Arabic compared to German native speakers

Differences in connectivity between regions

Specific German Language Network

(top view)

German native speakers:

Stronger connectivity in the left frontal-parietal-temporal language network, associated with complex syntax processing

German > Arabic

Specific Arabic Language Network

(top view)

Arabic native speakers:

Stronger inter-hemispheric and left temporo-parietal network connecting semantic language regions related to rich morphological processing in Arabic

Arabic > German

Wei et al. Neuroimage 2023

Take home message

- During development, the brain network “hard codes” the (language) experience
- Related to different processing regions and strategies in different languages
- Differences in network properties reflect the neural adaptations
-> specific linguistic features of a particular language
- Differences in this hardware might also modulate reasoning in other cognitive domains (this network is not only used for language)
- The brain connections, our connectome, reflects parts of our personality

Thank you!

شكراً جزيلاً!
